

## Welcome

"No effect in the world comes without a cause; understand it and you don't need to try"

Nessun effetto è in natura senza ragione; intendi la ragione e non ti bisogna sperienza"

-

Leonardo da Vinci (Vinci 1452::Clos-Lucè; 1519)

This phrase represents the starting point of the scientific approach to the science and technology. Leonardo was the really first engineer of the modern age, intending the multi disciplinary approach as the key for the knowledge of complex phenomena. This inspiration pass through our minds toward recent advances of electronics and computer science. Our idea is that only with an integrated and multi disciplinary approach it is possible to solve with success complex problems. The high level of integration between hardware and software system is the key of success for the production systems and even for the product itself.

Our mission: Pragma Engineering supplies design and development services, manufacturing (protos and series) custom hardware and software. When a new project begins an high degree of care is paid to its start-up phase regarding problem analysis and specification compiling, which implies the direct involvement of customer personnel creating multi disciplinary working groups. It means that our contribution is proposed as technological partners of customer business and not simply as external service; so we can afford project management skills as well as project financing counselling, designing development plans with the ability to collaborate with the customer staff structure.
